In statistics, a fixed effects model is a statistical model in which the model parameters are fixed or non-random quantities. This is in contrast to random effects models and mixed models in which all or some of the model parameters are random variables. In many applications including econometrics and biostatistics a fixed effects model refers to a regression model in which the group means are ...

Using Regression Models for Forecasting (SW Section 14.1) Forecasting and estimation of causal effects are quite different objectives. For forecasting, o R2 matters (a lot!) o Omitted variable bias isn't a problem! o We will not worry about interpreting coefficients in forecasting models o External validity is paramount: the model estimated

Linear mixed models are an extension of simple linear models to allow both fixed and random effects, and are particularly used when there is non independence in the data, such as arises from a hierarchical structure. For example, students could be sampled from within classrooms, or patients from within doctors. When there are multiple levels, such as patients seen by the same doctor, the ...

Logistic regression does not make many of the key assumptions of linear regression and general linear models that are based on ordinary least squares algorithms – particularly regarding linearity, normality, homoscedasticity, and measurement level.. First, logistic regression does not require a linear relationship between the dependent and independent variables.
